### Max. turning dia. X length

- Lynx 220A [LA] **ø 320 x 322 [ 542 ] mm**  
(ø 12.6 x 12.7 [ 21.3 ] inch)

- Lynx 220LMSA / LMSC **ø 300 x 510 mm**  
(ø 11.8 x 20.1 inch)

The heavily ribbed torque tube design prevents twisting and deformation. All guideways are wide wrap-around rectangular type for unsurpassed long-term rigidity and accuracy.

## Rapid Traverse

Roller-type LM Guide is mounted on the machine to improve rigidity and feedrates. Each axis is powered by a maintenance free digital AC servo motor. These high torque drive motors are connected to the ball screws without intermediate gears for quiet and responsive slide movement with virtually no backlash.

## Main Spindle

The C-axis is positioned in degree increments of 0.001. Through spindle synchronization with the X and Z axes, three dimensional contouring, complex and prismatic machining can be accomplished.

## Headstock and spindle

The headstock and main spindle are manufactured in a temperature controlled environment then assembled and tested in our clean room. The heavy duty cartridge type spindle is supported by a triple row angular ball bearing in the front, with a row cylindrical roller bearing in the rear. This combination of bearings is very effective in refraining from thermal displacement of its front nose and improving high speed performance and its rotational precision.

## 2 axis Servo Turret (A/B/C)

Rigidity and efficiency provide increased machine performance.

heavy duty turret features a large 210mm diameter curvic coupling and 39 kN of hydraulic clamp force. The heavy duty design provides unsurpassed rigidity for heavy stock removal, fine surface finishes, long boring bar overhang ratios, and extended tool life.

All turret rotations are controlled by high torque servo motor and turret indexing is non-stop-bi-directional, with a 0.11 second station to station index time.

## BMT Turret (MA / MC / LMA / LMC / LMSA / LMSC)

BMT turret makes it possible to complete complicated parts requiring many tools in just one set-up. Reliable servo driven turret reduces the total cycle time required to machine parts.

## Tailstock

Widely spaced guideways and heavy-duty design of the tailstock body ensure ample rigidity. The tailstock body is positioned by traction bar, which engages with the carriage. The traction bar movement and hydraulic body clamping are manual.

## Sub Spindle (LMSA / LMSC)

The travel time of the workpiece is minimized, because the travel of workpiece between both spindles is carried out under a state of revolution through the synchronized control of revolution speed. In addition, the cutting performance is enhanced because the cross-sectional adhesion of the workpiece at the axis of the servo spindle is secured by the use of a torque skip function when travelling to the B axis.
